AN ECLECTIC TECHNOLOGIES COMPANION REGISTER TO THE FOUNDATIONAL DEFINITIONS

FD-REG — The Governing Stack Register

The Version State of the Foundational Definitions

Version 0.33 — DRAFT · 17 October 2026

SUGGESTED CITATION

T. Roxey, "FD-REG — The Governing Stack Register," Version 0.33, in *FD — Foundational Definitions, November 2026 Edition*, Eclectic Technologies, October 2026. https://doi.org/10.5281/zenodo.23401272

This version is a member of FD — Foundational Definitions, November 2026 Edition (https://doi.org/10.5281/zenodo.23401272). The edition is a dated coherence claim: it states the family's state as of 19 October 2026 and is not falsified by a later revision. The earlier October 2026 Edition (https://doi.org/10.5281/zenodo.23117612), September 2026 Edition (https://doi.org/10.5281/zenodo.23000686) and August 2026 Edition (https://doi.org/10.5281/zenodo.22181029) remain citable for what they contain. Version state is authoritative in FD-REG, whose dated copy accompanies this edition. All editions: https://doi.org/10.5281/zenodo.22181028.

Designation: FD-REG
Family: Foundational Definitions — register
Version: 0.33 — DRAFT (issued with the November 2026 Edition; supersedes v0.32. The October 2026 Edition carries v0.22)
Date: 17 October 2026
Author: Tim Roxey
Organization: Eclectic Technologies
Status: Authoritative for the version state and issue status of the instruments named in §3. Not authoritative for their content, which each instrument owns.
Adjacent: Corpus Rules/Note on Citation Form and the FD Stack, the determination this register exists to make safe · CR-OT §6, version-bearing citations · FD-BL §2.1, propagation by reference

---

1. Why This Register Exists

A citation that names a version resolves to that version and not to the instrument's current text. CR-OT §6 states the consequence: where the version named has been superseded and the superseded file remains obtainable, a reader following the citation arrives at the old claim and stops there, having found text that answers the question. For that reader the revision did not occur.

The Foundational Definitions are the worst case of that defect, and for a structural reason. Roughly forty instruments inherit the Bright Line, and they inherit it *from* FD-BL. A sector framework carrying a stale

pin to a facility instrument can still be caught, because both sit under a definition that governs them. A document reading a superseded FD-BL has no upstream authority left to check itself against. The stale pin to a Foundational Definition is the one citation in the corpus that inheritance cannot catch.

The remedy already exists in the corpus. The DBA-EN series adopted it at DBA-EN-SF v0.12 §7, closing OI-CL-2: an in-series citation carries no version token, and the version lives in the series register. A citation with no version cannot resolve to superseded text, which removes the defect class rather than repairing its instances one at a time.

That convention has a precondition, and the Project 6 session found it by trying to adopt the convention without one. Stripping the token moves the version somewhere; if no register holds it, the version is nowhere authoritative, which is worse than the drift it replaced. Project 6 has no register-shaped section in the DBA-MA series and therefore could not adopt.

This register is that precondition for the Foundational Definitions.

2. Scope

This register records the designation, current version, issue status and master location of each instrument in the Foundational Definitions family, and of the production renders derived from them. It states no concept, varies no definition, and carries no authority over what any instrument says. Its whole function is to be the one place a reader goes when a citation has deliberately declined to name a version.

3. The Register

Designation	Instrument	Current version	Status	Master on disk
FD-BL	The Bright Line — placement, granularity, scope, and the obligation; §4.3 defines one action; §4.4 cites FD-LD §4.3 for scope; §4.5 states that the Command Broker discharges in the moment or in advance	v0.6	Issued in the November 2026 Edition; v0.5 is in the October 2026 Edition	FD Governing Stack/FD-BL_Bright_Line_Definitional_Standard_v0_6.md
FD-LD	Layer Decomposition and Determinism — the companion root that owns scope: §4.3 carries the	v0.5	Issued in the November 2026 Edition; v0.4 is in the October 2026 Edition	FD Governing Stack/FD-LD_Layer_Decomposition_and_Determinism_v0_5.md

	governing statement of scope, as the complement of the carve-out, and FD-BL §4.4 cites it; §4.8 records two gaps			
FD-EV	The Envelope — reserves “envelope” for the authorization sense; “operating band” for the operational sense, with a sector’s established term permitted at §4.3	v0.2	Issued in the October 2026 Edition and carried unchanged into the November 2026 Edition; resolves FD-BL §6.3	FD Governing Stack/FD-EV_Envelope_v0_2.md
FD-LS	Local Sovereignty — protective function executing on physical law, colocated, requiring no authority from any reachable system; the burden of proof on the intermediation. **Originated by Project 5**, which holds the construct; this instrument is its definition of record and Project 0 is its home, not its author. **Accepted as drafted by Project 5, 7 September 2026**, and **§6.1 records that there is no general form** —	v0.6	Issued in the October 2026 Edition and carried unchanged into the November 2026 Edition; §3.2 restated and accepted by Project 5, 2 October 2026	FD Governing Stack/FD-LS_Local_Sovereignty_v0_6.md

	the Analyst Sovereignty Principle inherits §3.3 by citation and is not an instance of the construct, **closed jointly by Projects 5 and 3 and dating to Project 3's acceptance**			
FD-BR	The Broker — the role-type that discharges a Bright Line's authorization obligation, in the moment or in advance, and its two instantiations: the Command Broker paired to FD-BL and the Influence Broker paired to FD-SBL; owns the Gate and the substitution rule	v0.11	Issued in the October 2026 Edition and carried unchanged into the November 2026 Edition	FD Governing Stack/FD-BR_Broker_Definitional_Standard_v0_11.md
FD-SBL	The Surveillance Bright Line — the placement criterion for autonomous influence and mass-surveillance actions against democratic processes. **Owned by Project 1; this row is advisory**	as FD-SBL-REG records	DRAFT; held from release	Project 1's folder; authoritative version state carried by **FD-SBL-REG**, Project 1's register
FD-SBL-D1	Indication Integrity and Substantive Authorization — determines FD-SBL §6.1; splits the obligation into	as FD-SBL-REG records	DRAFT; held from release	Project 1's folder; as above, FD-SBL-REG

	a prohibited class and an authorizable class. **Owned by Project 1; this row is advisory**			
FD-SBL-D2	Mode of Discharge — determines FD-SBL §6.2; advance discharge unavailable, the Influence Broker not substitutable, on present understanding. **Owned by Project 1; this row is advisory**	as FD-SBL-REG records	DRAFT; held from release	Project 1's folder; FD-SBL-REG
FD-BL-D1	Mode of Discharge — advance discharge under R1–R3; the two-object model; the §7 reach clause	v0.5	Issued in the October 2026 Edition and carried unchanged into the November 2026 Edition; determination under FD-BL, resolving §6.1	FD Governing Stack/FD-BL-D1_Mode_of_Discharge_v0_5.md
FD-BL-D2	Indication Integrity — I1–I3, traceable and corroborated inputs, reaching placement and discharge inputs	v0.5	Issued in the November 2026 Edition; v0.4 is in the October 2026 Edition; determination under FD-BL, resolving §6.2	FD Governing Stack/FD-BL-D2_Indication_Integrity_v0_5.md
FD-DBL	Design Basis Layers — the Design Basis, accident and adversary layers; the service function as the invariant; the accident layer's	v0.16	Issued in the November 2026 Edition, its first issue, as the family's eighth member (author determination, 3 October 2026); v0.16 replaced	FD Governing Stack/FD-DBL_Design_Basis_Layers_v0_16.md

three assumptions; intentionality, persistence, precision and denial as the canonical adversary set, all four required; the change in success criterion; the operating limits; the layer as an input to AI governance; cyber running through every layer; a consolidated ontology at §2.3; Figure 1; §6.4 records how an event short of denial, or with a characteristic not determined, is recorded, that a state's surveillance and covert theft operations are military action, Design Basis Layers — the Design Basis, accident and adversary layers; the service function as the invariant; the accident layer's three assumptions; intentionality, persistence, precision and denial as the canonical adversary set, all

v0.15 in the edition before deposit (author decision, 17 October 2026)

four required; the change in success criterion; the operating limits; the layer as an input to AI governance; cyber running through every layer; a consolidated ontology at §2.3; Figure 1; §6.4 records how an event short of denial, or with a characteristic not determined, is recorded, that a state's surveillance and covert theft operations are military action, and that the characteristics may be read against a campaign on a facility's dependencies; §4.4 states the adversary's aim as defeating the function or a requirement on how it is performed, and §6.4 records that a falsified view of the process is not denial

All three of FD-BL's §6 open items are determined. Placement is action-level consequence; determinism is scope only; the obligation is the Command Broker; the envelope and operating-band terms are reserved.

4. Production Renders

The sub-sections of this section stand in the order in which they were added, newest first, not in numerical order: §4.6, then §4.5, §4.4, §4.2A, §4.3, §4.1 and §4.2. The paragraphs of §4 above its first sub-section are the record of the August 2026 Edition and its renders as they stood in mid-September 2026; §4.4 records the September 2026 Edition and §4.5 the October 2026 Edition.

The FD Governing Stack/production/ folder holds the rendered edition set: the August 2026 Foundational Definitions edition front matter, followed by FD-BL, FD-LD, FD-EV, FD-BR, FD-BL-D1 and FD-BL-D2 as paired .docx and .pdf. **FD-LS has no render**, having issued after that edition was cut; whether one is added is recorded as an author decision at FD-LS §8. The edition therefore covers six of the seven masters, which is a gap in the render set and not a defect in the register. A render is a derived copy and is current only as of the edition date on its front matter. Where a render and its master disagree, the master governs and the render is stale, which is the ordinary direction of drift and not a finding about the register.

FD-LD's render was cut twice on 13 September 2026, the master having moved twice. **The current pair is production/02_FD-LD_Layer_Decomposition_and_Determinism_v0_3.docx, MD5 b4e2c1fb54b672f1a76aff3b9da8fca9, 30,847 bytes, with its PDF at 0c9154c4d419691c44093a265a62f099, 122,381 bytes.** The v0.2 pair is superseded and goes to _archive/ by the author's hand; it was never deposited or sent, and it carried the defect recorded at §4.2.

The three outstanding renders were cut on 13 September 2026 and the render set is now current for the first time since the edition.

Render	MD5 (.docx)	MD5 (.pdf)	Note
04_FD-BR_The_Broker_v0_6	b4aea1d193283832648ade62dd1baffb	7a8832ad957abd237d38425f01e9b829	New file. **04_..._v0_1 stays** — it is an edition member
05_FD-BL-D1_Mode_of_Discharge_v0_4	f3212441fd97703717b4aac0cf8c6ec3	91053bdc12669bc3fff8fc382ad66443	Replaces the file of the same name; predecessor captured (§4.3)
06_FD-BL-D2_Indication_Integrity_v0_3	91ec150541225da5439ad3d284df0319	773c00157e194ee7e06c78d997a04580	Replaces the file of the same name; predecessor captured (§4.3)

Each was cut against 02_FD-LD_..._v0_3 as the reference, carries the four styles recorded at §4.1 and §4.2, was schema-validated, and was read end to end under CR-TA before it left the project.

4.6 The November 2026 Edition, cut 15 October 2026

The October 2026 Edition is published, as a new version of the family's Zenodo record under version DOI 10.5281/zenodo.23117612 (https://zenodo.org/records/23117612), confirmed by the author on 15 October 2026. It stands as a dated coherence claim and nothing below changes it.

A fourth edition is cut: *FD — Foundational Definitions, November 2026 Edition*. It is to be deposited as a new version under the family's concept DOI, 10.5281/zenodo.22181028. Its members are FD-BL v0.6, FD-LD v0.5, FD-EV v0.2, FD-BR v0.11, FD-BL-D1 v0.5, FD-BL-D2 v0.5, FD-LS v0.6 and, as the family's eighth

member, FD-DBL v0.16, with this register at v0.33 as companion. The masters that moved carry every edit the November cycle queued: the two FD-BL §4.3 edits (v0.28, v0.30), the FD-BL-D2 sufficiency edit (v0.30), the two FD-LD edits (v0.25, v0.29), and the FD-DBL edit on the duty to defend, approved by the author as drafted on 15 October 2026. **FD-DBL moved again before deposit.** On 17 October 2026 the author answered the three questions Project 6 referred from the *Nuclear Sector Framework* (DBA-NUC-SF) §9.2, and decided to bring the answer into this edition rather than hold it for December. FD-DBL v0.16 replaces v0.15 as the eighth member, and this register moves to v0.33 with it. Renders 00, 08 and 09 are re-cut; renders 01 to 07 are unchanged. The v0.15 render pair, the v0.32 companion pair and the first front-matter pair were never deposited, and were moved the same day to _archive/production/November_2026_Edition_Superseded_Before_Deposit/. FD-EV, FD-BR, FD-BL-D1 and FD-LS do not move; their renders are re-cut because each render names its edition (§4.3). The formal statement of the corpus's axioms, once intended for this edition, is deferred to the December 2026 Edition by the author's decision of 15 October 2026. **The version DOI is 10.5281/zenodo.23401272**, reserved by the author on the New Version draft on 15 October 2026, and every render prints it in its citation block. The edition carries the date 19 October 2026 in its citation blocks and front matter, and is to be deposited on or after that date. **The render set is cut in full** into production/November_2026_Edition/, as 00_FD_Foundational_Definitions_November_2026_Edition through 08_FD-DBL_Design_Basis_Layers_v0_16, with the companion 09_FD-REG_Governing_Stack_Register_v0_33. Each render is cut against its own October 2026 Edition render as reference document; FD-DBL, having none, is cut against FD-BL's. The PDFs are exported with LibreOffice from those renders, as the October 2026 Edition's were, with Carlito embedded for Calibri. Hashes go in the deposit sheet, not here.

4.5 The October 2026 Edition, cut 2 October 2026

A third edition is cut: *FD — Foundational Definitions*, *October 2026 Edition*. It is to be deposited as a new version under the family's concept DOI, 10.5281/zenodo.22181028. Its members are FD-BL v0.5, FD-LD v0.4, FD-EV v0.2, FD-BR v0.11, FD-BL-D1 v0.5, FD-BL-D2 v0.4 and FD-LS v0.6, and this register at v0.22 accompanies them as a companion, not a member. It is a repair edition: it closes the twenty-seven findings of the independent review of 29 September 2026, under the five author determinations of 2 October 2026 and the Action Plan for the October 2026 Edition, and it takes the seventeen findings of a cold review of its own review draft, run the same day. The surveillance branch is not in this edition.

The render set is cut in full into production/October_2026_Edition/, as 00_FD_Foundational_Definitions_October_2026_Edition through 07_FD-LS_Local_Sovereignty_v0_6, with the companion 08_FD-REG_Governing_Stack_Register_v0_22. Each instrument's render is cut against its own September 2026 Edition render as reference document, which carries the corrected styles of §4.1 and §4.2 and its page furniture. Their hashes go in the deposit sheet, not here, because this register is itself one of the files hashed. **The version DOI is 10.5281/zenodo.23117612**, reserved by the author on the New Version draft on 3 October 2026, and every render prints it in its citation block. The review-draft renders of the same day, in production/October_2026_Edition_Review_Draft/, are superseded by this cut and were never deposited.

The September 2026 Edition is untouched and stays as published, a dated coherence claim under its own version DOI, 10.5281/zenodo.23000686.

4.4 The September 2026 Edition, cut 27 September 2026

A second edition is cut: *FD — Foundational Definitions*, *September 2026 Edition*. It is to be deposited as a new version under the family's concept DOI, 10.5281/zenodo.22181028. Its members are FD-BL v0.4,

FD-LD v0.3, FD-EV v0.1, FD-BR v0.10, FD-BL-D1 v0.4, FD-BL-D2 v0.3 and FD-LS v0.5, which is its first published appearance. This register accompanies them as a **companion, not a member**: it is a register, not a Foundational Definition. Its copy in the edition is dated, and its master governs thereafter. The surveillance branch (FD-SBL and its determinations) is **not in this edition**. It is Project 1's, and it is held from release pending external review.

The render set is re-cut in full, not only for the instruments that moved. Every render's front matter names the edition it belongs to, and §4.3 records what happens when front matter is left behind a regenerated body. All eight renders are cut against 02_FD-LD_Layer_Decomposition_and_Determinism_v0_3 as the reference document, per §4.1 and §4.2. The file names are 00_FD_Foundational_Definitions_September_2026_Edition through 07_FD-LS_Local_Sovereignty_v0_5, and the companion is 08_FD-REG_Governing_Stack_Register_v0_21. Their hashes are recorded in the deposit sheet, publications/ZENODO_DEPOSITS_BATCH_4.md, not here, because this register is itself one of the files hashed.

The August 2026 edition is untouched. Its seven files remain in production/ and in the publications mirror, under its own version DOI, as a dated coherence claim. **What this edition's coherence claim covers is narrower than the August claim, and its front matter says so.** The members were read against one another in the act that cut them. No corpus-wide reconciliation was run for this edition.

Where these renders now are, noted 3 October 2026. After the October 2026 Edition was cut, the author moved the earlier renders out of FD Governing Stack/production/ into the Project 0 archive. The September 2026 Edition's eighteen files are now in _archive/production/September_2026_Edition/, at the root of the Project 0 folder and not inside FD Governing Stack/. The August 2026 Edition's files, with the later renders §4 records beside them and the two captures of §4.3, are loose in that same _archive/ folder. The October 2026 Edition's review-draft renders named at §4.5 are in _archive/production/October_2026_Edition_Review_Draft/, and the cut that carried a placeholder DOI is in _archive/production/October_2026_Edition_draft_with_placeholder_DOI/. production/ now holds only October_2026_Edition/. Where §4 above and §4.4 and §4.5 say a render is in production/, read that as where it was when the sentence was written. Nothing was changed by the move: each edition's membership is its enumeration here and its deposit record, and its published copy is the Zenodo deposit and the publications mirror, neither of which moved.

4.2A What an instrument of this family owes in rendered form

The production render is the print artifact. A working .docx twin beside the master is not owed and its absence is not a gap.

FD-LD v0.1 and v0.2 each had a .docx beside the markdown master in FD Governing Stack/; **v0.3 has none, and the author determined on 13 September 2026 that this is the correct state.** The production render carries the house form, the citation block and the page furniture; a working .docx carries a subset of that and goes stale the moment the master moves. **Where the two disagree the render is the one to print.**

It is recorded because the absence looks like an omission. A session tidying this folder would otherwise see a pattern broken in one instrument and repair it, producing a second derived copy nobody asked for and a second thing to keep current.

4.3 What the two determination renders actually were, found 13 September 2026

FD-REG v0.2 recorded that the FD-BL-D1 and FD-BL-D2 production renders were regenerated on 3 September and their predecessors archived. Both halves of that are true. The bodies were regenerated from the v0.4 and v0.3 masters — each carries its master's newest revision-history entry and its conformed citation form — and the edition's v0.3 and v0.2 renders are in _archive/ where the record says.

What no record said, because nobody read the rendered first page: the front matter did not move with the body. 05_…_v0_4 opened *Version 0.3 — DRAFT*; 06_…_v0_3 opened *Version 0.2 — DRAFT*. Each carried its old suggested-citation block with it, so each cited itself at the superseded version and asserted membership in the August 2026 edition for a text that is not in it.

The cause is structural rather than careless, and it is the reason this section exists. In this render form the body is derived from the master and the **front matter is hand-built**. A regeneration rebuilds everything derived and touches nothing that is not. **The version line is the one place in the document where the two meet**, and nothing in a regeneration reaches it.

Both predecessors were captured before being overwritten, under CR-CO, to _archive/ at names that state the discrepancy rather than a version: 05_FD-BL-D1_Mode_of_Discharge_render_body_v0_4_cover_said_v0_3_CAPTURE_2026-09-13 at MD5 26b9b9c19e2e9df9d6b512fb831a440e (.docx) and fff7cd52717ec088e062efe215ca7cd4 (.pdf); 06_FD-BL-D2_Indication_Integrity_render_body_v0_3_cover_said_v0_2_CAPTURE_2026-09-13 at 739a98d08c1b752eb99105afa7345555 and 91fb0eccb02cb59d24fae9d187179180. **A capture named for a version it does not consistently carry would reproduce the defect in the archive.**

FD-BR was the simple case and is recorded so the three are not confused. Its render stood at v0.1 against a v0.6 master — filename, front matter and body all agreeing on v0.1, five versions behind. Nothing was mislabelled; it had simply never been re-cut.

The v0.1 render stays. It is one of the seven files that constitute the published August 2026 edition, so production/ now holds **the edition set plus one newer render**, and the folder is no longer a listing of the edition. **The edition's membership is the enumeration in the paragraph above and the deposit record in publications/ZENODO_DEPOSITS.md, not the contents of the folder.** That sentence is the whole reason this section names its seven members rather than saying *the folder holds the edition*.

4.1 A defect in the house render form, found 13 September 2026 and fixed in the v0.2 render

The reference document the FD renders are cut against is missing three styles, and one of them is Table. The others are BodyText and Compact. Every render emits <w:tblStyle w:val="Table"/> and <w:pStyle w:val="Compact"/>, and both resolved to nothing.

The consequence is that a table in an FD render is not laid out as a table. In 02_FD-LD_…_v0_1 — the render in the published August 2026 edition — the §3 concordance appears as an unlabelled run of stacked lines, header cells and body cells alike, with no rule, no columns and no alignment; and the §3 heading, which sits immediately above it, is thrown to the right margin. **The concordance is the one element of FD-LD whose entire value is being a table**, and a reader of the published PDF does not get one.

Why nothing caught it. FD-LD is the only instrument of the six in that edition that carries a table, so the defect had exactly one site in the whole edition, and it lives in the render rather than in any master — invisible to every check that reads markdown, and invisible to a diff, which compares renders that share the defect.

The corrected renders carry the missing styles and lay the tables out correctly, verified by rendering and reading every page. **The v0.3 render is the reference document for future FD renders**, and cutting the next one against 02_FD-LD_…_v0_1 would reintroduce the defect.

4.2 A fourth missing style, found the same day by the same means

BlockText was missing too, and the v0.2 render shipped without it. Pandoc sets a block quotation in BlockText; with the style absent, a quotation renders flush with the body text around it and a reader cannot see where it starts or ends.

The site is the one place in FD-LD where that matters most. §4.3 carries the canonical statement of the machine-learning carve-out as a block quotation, introduced as *reproduced here as governing* — **the sentence FD-BL §4.4 inherits.** In the v0.2 render it ran on as ordinary prose, so the governing text and the paragraph explaining it were typographically indistinguishable.

It was found by the terminal read of the v0.3 render and not by looking for it, which is the same way the Table defect was found four hours earlier. **Three of the four missing styles were found by reading a rendered page; none was findable in any master.** The v0.2 render stood for about an hour, was never deposited or sent, and is superseded by v0.3.

Nothing is done to the published edition and nothing should be. It is a dated coherence claim over a fixed deposit; the defect is recorded here as a known property of that artifact, in the manner CR-PB requires — a correction issues in a successor and never by editing what a version DOI resolves to.

No republish obligation fires against the published edition, and the reason should be stated rather than assumed. 00_FD_Foundational_Definitions_August_2026_Edition is deposited under version DOI 10.5281/zenodo.22181029 and is classified in Published_Artifact_Currency_Register as a **dated coherence claim**: it asserts the family's state as of August 2026 and is not falsified by a master moving afterwards. **A reader citing the edition is citing August 2026 and is correctly served; a reader wanting FD-LD's current text comes here.** That is the whole purpose of the distinction, and this is the first time since the edition was cut that a master named in it has moved.

5. Precedence: This Register and the Places That Mirror It

Six places in Project 0 presently carry the version state of this family. This register is authoritative for it. Each of the others is advisory, names this register as its source, and is reconciled to it whenever the recording document is touched.

Recording document	Relation
The Project 0 instructions, governing-stack line	Advisory mirror; reconcile on touch
The Project 0 sibling-project introduction, §4 governing-stack table	Advisory mirror; reconcile on touch
The FD-BL corpus sweep register, its Conformance Status dashboard	Advisory, and frozen — see below
The session handoff and transition notes	Advisory; session artifacts, reconciled only if reissued
The sibling-project introductions of Projects 1, 2, 6, 8 and 10	Advisory; each sibling's own instrument, cited by reference
The Body of Work White Paper	Advisory; a narrative orientation, not a register

The sweep-register dashboard deserves its own line, because it is the reason a purpose-built register was needed at all. It is a pass artifact. It was accurate when Pass 3 closed and it freezes there, as every completion record properly does — CR-OT §8 holds that a record of what a pass did continues to say what that pass did. A frozen record cannot carry a running state. Reading version state out of a pass artifact is how a stale pin becomes authoritative-looking, and this register exists so that nobody has to.

This is the register-precedence rule settled between Projects 6 and 8 on 2 September 2026, applied inside Project 0 to Project 0's own artifacts: a register is authoritative for the instruments its owning project owns and advisory for every instrument it records that another project owns.

6. Maintenance

The obligation runs with the issue rather than after it. An instrument of this family is not issued until this register records it at its new version, and the register is bumped in the same act. An entry that names a version this register does not carry is a finding, not a variation.

Where a version token has been used for more than one text, the fix is an entry here that resolves it, never a rename of the surviving instrument. That remedy pattern is established: it is what _superseded/Introduction_v1_9_Disambiguation_Note.md did for the four-MD5 ambiguity in the DBA-MA series.

On this register's own designation, and on the suffix forms, recorded 5 September 2026. Project 1 issued FD-SBL-REG and asked, before the corpus learned the name, whether the form is right — the hazard being that -D1 in this family means *determination under*, so a reader might take -REG for a determination rather than a register.

Project 0's answer is that the form is right and should stand. The suffix -REG was already established corpus-wide as meaning *register*, by this instrument, before the question arose, and one established suffix is worth more than a better-shaped new one. The two suffix meanings are distinguished by shape and not only by string: determinations in this family are numbered — -D1, -D2 — and a register is not. The alternative form FD-REG-SBL reads well and was considered and rejected, because making register-ness the root and the branch the suffix implies that this register is parent to Project 1's, which is exactly the hierarchy §5 denies.

What is genuinely unwritten is the suffix rule itself, and that is the gap to close rather than the name. The rule as the corpus has been using it: -Dn designates a numbered determination under the named root; -REG designates the register of a branch. It belongs in the designation register when DN-OI-3 is taken, alongside the CB- and CDB- prefix entries, and it is CR-DP's subject — prefixes and suffixes allocated corpus-wide rather than per series.

One asymmetry should be recorded rather than left for a reader to trip on. **This register is not FD-BL-REG and never was a root-scoped register.** It records FD-BL, FD-LD, FD-EV, FD-BR and FD-LS, which are five roots, plus two determinations. (Until v0.22 this sentence counted four roots; FD-LS had issued since it was written.) It carries the bare family name because it was issued before the family had a second branch with a second owner, and it is retained rather than renamed because it is cited widely and the cost of the rename exceeds the cost of this paragraph. FD-SBL-REG and this register are parallel objects — branch registers of one family — with non-parallel names, and that is a historical fact rather than a defect in either.

The scope of that prohibition, ruled 5 September 2026 on Project 1's question. The rule addresses a **live ambiguity**: two or more texts remain obtainable under one token, a reader following a citation may land on either, and renaming the survivor destroys the only evidence that the reader's problem exists. The four-MD5 case is that case exactly. It does not reach a file that merely **mislabels its own contents** — where the competing text does not survive, nothing is ambiguous to any reader, and the filename is simply wrong about the document beneath it.

The distinguishing test is whether a reader can arrive at the wrong text. If they can, the rename is barred and an entry here resolves it. If they cannot, the rename is permitted **and the entry here is still owed**, because the token's reuse across time is a fact about the corpus and this register is where it is recorded.

Applied to the case that produced the ruling: FD-SBL_Surveillance_Bright_Line_Definitional_Standard_v0_1.md in Project 1's folder holds the v0.2 text — character-identical to the .docx beside it, both declaring v0.2 in their own headers — and no copy of the true v0.1 survives anywhere on the mirror, having been overwritten in place rather than superseded. **Project 1 may rename it to _v0_2.md, and this register records that the token FD-SBL v0.1 named the current v0.2 text on disk until 5 September 2026 and that no copy of the original v0.1 text survives in any store.**

7. Revision History

Version	Date	Author	Description
0.33	17 October 2026	Tim Roxey	**Issued with the November 2026 Edition.** Carries **FD-DBL to v0.16** in the same act as that instrument's revision, per §6, and brings it into the November 2026 Edition before deposit in place of v0.15 (author decision, 17 October 2026). §4.4 of FD-DBL restates the adversary's aim, and §6.4 and a new §8.2E record the author's answers of 17 October 2026 to the three questions Project 6 referred in Note 2026-10-17d. §4.6 records the replacement and the re-cut of renders 00, 08 and 09. The DOI and the edition date are unchanged. No

			other row changes.
0.32	15 October 2026	Tim Roxey	**Issued with the November 2026 Edition.** §3 records FD-BL v0.6, FD-LD v0.5, FD-BL-D2 v0.5 and FD-DBL v0.15 as issued in that edition, FD-DBL for the first time, and FD-EV, FD-BR, FD-BL-D1 and FD-LS as carried unchanged into it. §4.6 records the version DOI 10.5281/zenodo.23401272, the edition date of 19 October 2026, and the render set in production/November_2026_Edition/.
0.31	15 October 2026	Tim Roxey	**Working master, not issued.** Records that the October 2026 Edition is published under version DOI 10.5281/zenodo.23117612, and opens §4.6 for the November 2026 Edition. Carries **FD-BL to v0.6**, **FD-LD to v0.5**, **FD-BL-D2 to v0.5** and **FD-DBL to v0.15** in the same act as those revisions, per §6, each taking in the edits queued for the November cycle at v0.25 and v0.28–v0.30; FD-DBL takes in its queued edit on the duty to defend, approved by the author on 15 October 2026. Records FD-DBL as entering the November 2026 Edition as the family's eighth member, and the

			deferral of the axioms to the December 2026 Edition.
0.30	14 October 2026	Tim Roxey	**Working master, not issued.** Records two further queued edits for the November cycle, from Determination_2026-10-14b_Enterprise_Network_Changes_Count_and_Indication_Integrity_Requires_Sufficiency: to **FD-BL** §4.3, that a change a component within scope makes to an enterprise network is an action placed on its consequence (beside the vendor-release text queued at v0.28); and to **FD-BL-D2**, that an indication can be correct and insufficient, correctness being necessary and not sufficient, with what is missing identified and sought before the authorization is relied on. FD-BL stays at v0.5 and FD-BL-D2 at v0.4 until that cycle; their rows are unchanged.
0.29	14 October 2026	Tim Roxey	**Working master, not issued.** Records that the November cycle carries a **second queued edit to FD-LD**, approved as drafted by the author on 14 October 2026: FD-LD_Queued_Edit_for_the_November_Cycle_Where_the_Layer_Split

			_Began v0.2, which adds a Record section R.7 and two provenance-only references tracing the layer split to the author's 2025 formal-methods papers. It joins the edit of 8 October 2026; FD-LD stays at v0.4 until that cycle, and its row is unchanged. No definition changes.
0.28	14 October 2026	Tim Roxey	**Working master, not issued.** Records that the November cycle carries a **queued edit to FD-BL** §4.3, from Determination_2026-10-14_Three_Author_Decisions_Continuity_Classes_Vendor_Releases_and_Staged_Releases: a vendor's release to a population of hosts is not by itself an action under §4.3, its vendor-side controls being contractual obligations of the asset owner-operator; and each widening of a staged release is its own action, the first placed on its whole planned reach. FD-BL stays at v0.5 until that cycle, and its row is unchanged. Also records, as pending the author's approval and not yet queued, the provenance edit drafted for FD-LD on 14 October 2026 (FD-

			LD_Queued_Edit_for_the_November_Cycle_Where_the_Layer_Split_Began v0.1). No other row changes.
0.27	14 October 2026	Tim Roxey	**Working master, not issued.** Carries **FD-DBL to v0.14** in the same act as that instrument's revision, per §6: §6.4 and a new §8.2C record two rulings of the author of 14 October 2026, carried to Project 0 by Project 11's note 14o. A state's surveillance and covert theft operations, including the sale of drugs and the laundering of money, are military action, the tier still requiring all four characteristics on the record (made on DBA-IT-RE-1 and DBA-FIN-RE-1); and the four characteristics may be read against a campaign on a facility's dependencies rather than against the facility as an aim (made on DBA-FIN-RE-3, confirming DBA-ESS-RE-9). FD-DBL remains held for the edition following the October 2026 Edition. The queued November edit to FD-DBL, FD-DBL_Queued_Edit_for_the_November_Cycle_The_Tier_Moves_the_Duty_to_Defend_Not_the_Duty_to_Survive v0.1, names v0.13 as its

			base; its edits are unaffected and its base is read as v0.14. No other row changes.
0.26	13 October 2026	Tim Roxey	**Working master, not issued.** Carries **FD-DBL to v0.13** in the same act as that instrument's revision, per §6: §6.4 and a new §8.2B record the author's ruling of 13 October 2026 that a characteristic not determined on the record counts as not present, so that an event with one or more of the four characteristics not determined is recorded as military action without the military-action tier. Made on DBA-DAMS-RE-1 (Kakhovka) and DBA-HPH-RE-3 (Okhmatdyt), written by Project 11. FD-DBL remains held for the edition following the October 2026 Edition; no other row changes.
0.25	13 October 2026	Tim Roxey	**Working master, not issued.** Carries **FD-DBL to v0.12** in the same act as that instrument's revision, per §6: §6.4 and a new §8.2A record the author's ruling of 10 October 2026 that the military-action tier is not met without denial, made on the Kerch Strait Bridge reference event and asked of Project 0 by Project 9's note of

			10 October 2026. FD-DBL remains held for the edition following the October 2026 Edition. **Also records that the November cycle carries one queued edit to FD-LD**, the configuration sentence and the widened §7 item of Determination_2026-10-08_Untested_Logic_Is_Not_Covered_by_the_Carve-Out; FD-LD stays at v0.4 until that cycle, and its row is unchanged.
0.24	4 October 2026	Tim Roxey	**Working master, not issued.** Adds a §3 row for **FD-DBL**, Design Basis Layers, at v0.11, as an instrument in development held for the edition following the October 2026 Edition. The row records it so that its citations resolve while it is drafted; it is not a member of any edition until an edition is cut that names it.
0.23	3 October 2026	Tim Roxey	**Working master, not issued.** Adds to §4.4 a note of where the earlier renders now are, after the author moved them from FD Governing Stack/production/ to the Project 0 _archive/: the September 2026 Edition in _archive/production/September_2026_Editio

			n/, the August 2026 Edition loose in _archive/, and the October review draft and placeholder-DOI cut under _archive/production/. The sentences of §4, §4.4 and §4.5 that name production/ are left as written and read as where each render was at the time. No deposit, mirror or edition membership changes.
0.22	2 October 2026	Tim Roxey	**Issued with the October 2026 Edition.** Step 7 of the Action Plan (F-23, F-21): §3's FD-LS row reads *v0.5* like every other row; §4 is annotated as standing in order of accretion, with its opening paragraphs marked as the August 2026 Edition record; §6 counts five roots, FD-LS included. **Records FD-BL at v0.5, FD-LD at v0.4, FD-EV at v0.2, FD-BR at v0.11, FD-BL-D1 at v0.5, FD-BL-D2 at v0.4 and FD-LS at v0.6**, each issued in this act as §6 requires, with their §3 descriptions rewritten to the October texts (the FD-LD row no longer calls FD-LD the source of an inherited carve-out statement, and the FD-BL row describes the definition of an action and the citation of FD-

			LD for scope). **Adds §4.5, the October 2026 Edition**, and annotates §4's order of accretion to match. **Annotation to the 0.12 entry, not an edit of it:** that entry records FD-LS's TLP:RED remark about the March 2017 prototype report as an open disclosure question; the author confirmed on 2 October 2026 that the report is no longer TLP:RED, and the question is closed (FD-LS R.6).
0.21	27 September 2026	Tim Roxey	**Records FD-BR at v0.10 and FD-LS at v0.5**, each closing an author decision: FD-BR §8's designation entry, and FD-LS §8's render entry. **Adds §4.4, the September 2026 Edition**: seven members, with this register as a dated companion, a full re-cut of the render set, and a narrower coherence claim than August's. **The three FD-SBL-branch advisory rows are made token-free** (*as FD-SBL-REG records*) and marked DRAFT and held from release. Before this, they carried v0.3, v0.1, v0.1 and FD-SBL-REG v0.2 against a branch now at FD-SBL v0.6, and an advisory row that pins a version is

			one more thing to go stale.
0.20	27 September 2026	Tim Roxey	**Records FD-BR at v0.9**: the author closes its §8 rule-and-value entry, confirming substitutability as a rule in FD-BR and a per-Line value in each Line document. No other instrument changes.
0.19	27 September 2026	Tim Roxey	**Records FD-BL at v0.4 and FD-BR at v0.8**, both issued in the same act as this register, per §6. FD-BL v0.4 conforms §4.5 to FD-BR and to its own §6.1: it replaces the stale *Open at this version* paragraph with the Command Broker's substitutability value and unit of authorization, stated by pointer to FD-BL-D1. It changes no placement, granularity, scope or obligation. FD-BR v0.8 records FD-BL's conformance at §7 and §8. **The production renders 01_FD-BL_The_Bright_Line_v0_3 and 04_FD-BR_The_Broker_v0_6 are behind their masters** and are not re-cut in this act.
0.18	27 September 2026	Tim Roxey	**Records FD-BR at v0.7**, in the same act as that instrument's revision, per §6. v0.7 conforms FD-BR to the surveillance branch revised on 26 September, on the ten

			divergences Project 1 enumerated at FD-SBL-D2 §10. The §8 rule-and-value entry is held open for the author. **The production render 04_FD-BR_The_Broker_v0_6 is now one version behind its master** and is not re-cut in this act; §4's table stands as a record of the renders cut on 13 September. The edition member 04_…_v0_1 is unaffected.
0.17	13 September 2026	Tim Roxey	**Adds §4.2A on what an instrument of this family owes in rendered form**, on the author's determination of this date: **the production render is the print artifact and a working .docx twin beside the master is not owed.** FD-LD v0.1 and v0.2 each had one and v0.3 has none; that is the correct state, the render carrying the house form, citation block and page furniture while a working copy carries a subset and goes stale the moment the master moves. Recorded because the absence otherwise reads as an omission and invites a tidying session to create a second derived copy nobody asked for.
0.16	13 September 2026	Tim Roxey	**Records the last three**

production renders as cut, so the render set is current against its masters for the first time since the August edition: 04_FD-BR_The_Broker_v0_6 as a new file beside the edition's v0.1, and 05_FD-BL-D1_…_v0_4 and 06_FD-BL-D2_…_v0_3 replacing files of the same name. Each cut against 02_FD-LD_…_v0_3, carrying the four styles at §4.1 and §4.2, schema-validated and read end to end under CR-TA. **Adds §4.3 on what the two determination renders were.** FD-REG v0.2's record that they were regenerated on 3 September and their predecessors archived is **true in both halves** — the bodies carry their masters' newest revision entries and conformed citations, and the edition's renders are in _archive/. **What no record said is that the front matter did not move with the body**: 05_…_v0_4 opened *Version 0.3*, 06_…_v0_3 opened *Version 0.2*, and each carried a suggested-citation block citing itself at the superseded version and claiming membership in an edition it is not in. **The**

			cause is structural: the body is derived from the master and the front matter is hand-built, and the version line is the one place the two meet. Both predecessors captured under CR-CO at names stating the discrepancy rather than a version, since a capture named for a version it does not consistently carry reproduces the defect in the archive. FD-BR is recorded separately as the simple case — v0.1 throughout, five versions behind, never mislabelled.
0.15	13 September 2026	Tim Roxey	Carries **FD-LD to v0.3** in the same act as that instrument's revision, per §6 — the concordance's third row restored in repaired form with the negation leading, on the author's determination of this date. Records the **v0.3 production render** as the current pair and the v0.2 pair as superseded and owed to _archive/. **Adds §4.2 on a fourth missing style in the house render form**, BlockText, found by the terminal read of the v0.3 render: a block quotation without it renders flush with the surrounding prose, and the site where that bit

			is §4.3's **canonical statement of the machine-learning carve-out**, introduced as reproduced here as governing and inherited by FD-BL §4.4 — set, in the v0.2 render, indistinguishably from the paragraph explaining it. **Three of the four missing styles were found by reading a rendered page and none was findable in any master**, which is what §4.1 says about the class and is now four instances rather than three.
0.14	13 September 2026	Tim Roxey	**Records the FD-LD production render at v0.2**, cut the same day the master moved, and discharges the obligation v0.13 had recorded as owed. Records that production/ now holds **the edition set plus a newer render**, so the folder no longer lists the August 2026 edition and the edition's membership is the enumeration at §4 together with the deposit record. **Adds §4.1 on a defect in the house render form**: the reference document the FD renders are cut against is missing the Table, BodyText and Compact styles, so <w:tblStyle

			w:val="Table"/> resolves to nothing and **a table in an FD render is not laid out as a table.** In the published August 2026 edition's 02_FD-LD_…_v0_1 the §3 concordance appears as a run of stacked unlabelled lines and the heading above it is thrown to the right margin — **the one element of that instrument whose value is being a table.** It escaped notice because FD-LD is the only instrument of the six carrying a table, so the class had a single site; it lives in the render and not in any master, and a diff between two renders that share it shows nothing. The v0.2 render carries the three styles, lays both tables out correctly, and **is the reference for future renders**. The published edition is not touched and should not be, being a dated coherence claim over a fixed deposit.
0.13	13 September 2026	Tim Roxey	Carries **FD-LD to v0.2** in the same act as that instrument's revision, per §6. v0.2 restores eleven pieces of the superseded annex that the v0.1 promotion dropped without saying so — three whole sections, the

canonical statement of the machine-learning carve-out, its justification, two load-bearing clauses, three concordance terms and the naming of the two document families — and corrects the three sentences in v0.1 asserting that nothing had been dropped. **The row's description now records that FD-LD carries the canonical carve-out statement**, which it did not between August and today, so that FD-BL §4.4's inheritance resolves to a text rather than to a paraphrase. **Also corrects this register's own FD-LS master path, which resolved to nothing.** The row read FD-LS_Local_Sovereignty_v0_3.md; that file was archived when FD-LS moved to v0.4 and the live master is FD-LS_Local_Sovereignty_v0_4.md. **The version column was carried and the path column was not** — the same row, the same edit, and only the column the editor was looking at. It is the FD-BR defect of v0.8 arriving in the other column: **a register whose function is to be the one place a citation resolves to had a row**

			resolving to a file that is not there, and unlike a stale version this one fails silently at the reader rather than producing a wrong answer. Recorded rather than corrected quietly, and registered as an instance under CR-CC (Corpus_Rules_Candidate_Register §9S). Records at §4 that FD-LD's production render is now stale and owed, and **states why no republish obligation fires against the August 2026 edition** — it is a dated coherence claim, the first of whose masters has now moved.
0.12	8 September 2026	Tim Roxey	Carries **FD-LS to v0.4** in the same act as that instrument's revision, per §6. **Neither change moves the credit.** §2.3 gains a sentence separating **origination** — Project 5's, unmoved — from the **lineage of the property**, which is Project 7's, on that project's determination of 8 September that three questions were doing the work of one word; its *both inherit from this through-line* is recorded as withdrawn, being a claim of descent where **the artifact chain is documented at every**

			link and the link between artifact and construct is documented nowhere. §9 gains the **provenance citation the instrument has lacked since first issue**, aurora_brightline_v03b, with the record that Project 0 named the omission on 6 September, called it its own, and let it stand through v0.2 and v0.3 — **an omission named and left standing across two bumps is a defect the naming did not fix.** Two conditions sit beside the citation rather than elsewhere: the cited artifacts are **not held** in Project 7's tree against a Document Note claiming otherwise, and the through-line summarizes a **TLP: RED** report in a document declared primary source material for four sibling projects, **which is with the author and outranks the section.** Project 5's acceptance of 7 September is undisturbed.
0.11	7 September 2026	Tim Roxey	Carries **FD-LS to v0.3** in the same act as that instrument's revision, per §6. **The correction is to who closed the general-form question, not to the answer.** v0.2 recorded §6.1 as

determined by Project 5 and dated the closure to that project's return note; **§6 reserved the question to Projects 3 and 5 jointly**, and Note_2026-09-07d_from_P0 §4 had stated that *neither of you can settle it alone*. **Project 3 put it back** at its return note of 7 September, and **Project 5 endorsed the correction against its own earlier request**, declining the offered reading under which the reservation ran to the *term* rather than the *question* — the one construction in which it had not erred. The closure now dates to Project 3's acceptance, which §6.1 states as the constitutive act, **on this instrument's own ground that a right living only in a note is one a later reader will not find.** §6.1 also records why the defect was invisible: **an agreed outcome leaves no artifact distinguishing it from an unopposed one**, so nothing was present and wrong and no reading or hash could find it — it was catchable only by the other owner noticing it had not been asked. The general shape is recorded there and **not registered as a**

			candidate, both owners having declined to propose a designation on one instance.
0.10	7 September 2026	Tim Roxey	Carries **FD-LS to v0.2** in the same act as that instrument's revision, per §6. **Project 5 accepted FD-LS as drafted** at Return_Note_2026-09-07_from_P5 — that project's first issued correspondence in the corpus — keeping both elements Project 0 had flagged as drafting rather than construct: the three conditions at §3.2 and §3.4's *arguable rather than doctrinal* record. And **§6.1 determines that there is no general form**: the Analyst Sovereignty Principle inherits §3.3 by citation and is **not an instance** of local sovereignty, because the three conditions are the construct and a principle satisfying none of them cannot be an instance of a property they define. Notice owed to Project 3, whose card records the ancestry as open and whose text should now say analogy; that text is Project 3's to change. **Two of FD-LS §8's three author decisions close**; the production render

			remains outstanding and the August edition still covers six of seven masters.
0.9	6 September 2026	Tim Roxey	Records **FD-LS — Local Sovereignty — at v0.1**, issued the same day, and exercises the §6 maintenance obligation in the same act as the instrument rather than after it. FD-LS closes the gap found when the author determined the construct is **Project 5's**: it was the only one of the four core constructs with no Foundational Definition, its definition of record sitting in an introduction card whose own document control disclaims normative force, so every downstream use was a restatement because there was nothing to cite. The row records Project 5 as originator and Project 0 as home rather than author. Notes at §4 that the August 2026 render edition covers six of seven masters, FD-LS having issued after it was cut. **This is the first instrument admitted to the family since the register issued**, and the first whose row names an owner outside Project 0 while the master sits inside it — the inverse of the

			advisory surveillance rows, where Project 1 holds both.
0.8	5 September 2026	Tim Roxey	**Corrects this register's own FD-BR row, which had stood at v0.3 against a v0.6 master.** The v0.7 and v0.6 entries both claim to have advanced it; neither did. Each edit was applied by pattern substitution against an expected prior value, the pattern failed to match, the substitution reported nothing, and no one read the row afterwards. So the register whose single function is to hold version state carried a stale version through two of its own maintenance acts — CR-VA's defect committed by the instrument the citation-form determination rests on, and the second time in two days that a mechanical edit's silence was taken for its success. Recorded rather than corrected quietly. Records FD-BR at v0.6, closing its third author decision on the Line document's stated value. Advances the advisory surveillance rows on Project 1's issue: FD-SBL to v0.3 and FD-SBL-REG to v0.2, and adds **FD-SBL-D2** v0.1. Fourth

			exercise of the §6 maintenance obligation, and the first in which an advisory row moved because another project's register moved rather than because this one did.
0.7	5 September 2026	Tim Roxey	Records FD-BR at v0.5: the substitutability ground recorded and the decision deliberately left open, the replacement ground named at §4.4, and the two Command Broker family pins at §9 stripped now that CB-REG has issued. Third exercise of the §6 maintenance obligation.
0.6	5 September 2026	Tim Roxey	Names **FD-SBL-REG v0.1** as the source of the two advisory rows, which Project 1 issued the same day, completing the reciprocal arrangement §5 sets out: one authoritative account per instrument, each branch register advisory for the other's. Answers Project 1's question on the designation — the form stands, because -REG was already established and determinations are numbered — and records the suffix rule as belonging in the designation register under DN-OI-3 rather

			than in either register. Records the asymmetry that this register is not root-scoped and carries the bare family name for historical reasons.
0.5	5 September 2026	Tim Roxey	Records FD-BR at v0.3 and corrects its row description, which named only the Command Broker and dropped the Influence Broker that FD-BR §4.2 establishes. Adds **advisory rows for FD-SBL and FD-SBL-D1**, which declare this family in their own headers and were absent from a register claiming to record it — the surveillance branch was missing from the family's own version register. Both rows are advisory under §5 because Project 1 owns those instruments and will carry them in its own register. Rules on the §6 rename prohibition: it reaches a live ambiguity and not a file that mislabels its own contents, with the test stated and the FD-SBL case resolved under it. Both the missing rows and the ruling are Project 1's findings, returned the same day.
0.4	5 September 2026	Tim Roxey	Records **FD-BR at v0.2**, issued the same day: the author's confirmation of the canonical term

			“Influence Broker” with the corresponding §8 entry struck, §6.1’s scope corrected from a single named instrument to the reservation binding wherever the variant appears, a dated reading of where it stands moved to §7, and the header’s companion line stripped of its version tokens. Second exercise of the §6 maintenance obligation. The production render 04_FD-BR_The_Broker_v0_1 is now stale against this master and is recorded as owed under §4.
0.3	3 September 2026	Tim Roxey	§5 cites the advisory mirrors by name rather than by path, so the rows survive the _admin and _correspondence reorganization and any later move. A path citation goes stale exactly as a version citation does, and the remedy is the same.
0.2	3 September 2026	Tim Roxey	Records FD-BL-D1 at v0.4 and FD-BL-D2 at v0.3, issued by the citation-form conformance pass of the same date, with both production renders regenerated and their predecessors archived. First exercise of the §6 maintenance

			obligation: the instruments were not issued until this register carried them.
0.1	3 September 2026	Tim Roxey	First issue. Establishes the single authoritative home for the version state of the Foundational Definitions, as the precondition for the bare-citation determination recorded in the Corpus Rules note of the same date. Records the six instruments at FD-BL v0.3, FD-LD v0.1, FD-EV v0.1, FD-BR v0.1, FD-BL-D1 v0.3 and FD-BL-D2 v0.2, and names the six advisory mirrors. Written after the Project 8 session reported FD-BL cited at two versions inside Project 0’s own folder.
